

AVOID A SHOCK: IS YOUR PROTECTION ROBUST?

Electricity is a common source of fires as well as serious injuries and even death. It is important that you keep safe by always checking equipment for common hazards before use. These checks don't require any electrical knowledge or skill but can make a big difference to your safety and to that of those around you.

Anything failing these checks must be taken out of service and labelled with a warning to others. All incidents of failed equipment should be reported and logged.
